

Class – P: **P** is a class of Languages that are decidable in polynomial time on a deterministic single – tape Turing – machine.

The Language is $2SAT = \{\langle \phi \rangle \mid \phi \text{ is a satisfiable 2CNF formula}\}$

A **cnf – formula** is said to be **2 cnf** if all the clauses have two literals.

Now we have to prove that $2SAT \in P$.

- Let ϕ be the **2cnf – formula** one variables x_1, x_2, \dots, x_n
- Let us construct the graph **G** for the give ϕ as follows :
 - The variables and their negations in ϕ are taken as vertices of graph **G**. That is, $V = \{x_1, \dots, x_n\} \cup \{\bar{x}_1, \dots, \bar{x}_n\}$.
 - For every clause of the form $A \vee B$ in ϕ , add a directed edge from \bar{A} to **B** and one from \bar{B} to **A** in graph **G**.
- So by the construction of the graph, it follows that, if there is an edge from **A** to **B** then there is an edge from \bar{B} to \bar{A} .
- Now let us suppose that there is a directed path from x_i to \bar{x}_i and from \bar{x}_i to x_i .
- The existence of a directed path from x_i to \bar{x}_i is equivalent to saying that $x_i \Rightarrow \bar{x}_i$ and the existence of a directed path from \bar{x}_i to x_i is equivalent to saying that $\bar{x}_i \Rightarrow x_i$. Together, they implying that $x_i \cong \bar{x}_i$, which is false.
- So if this condition occurs then the formula ϕ has an un-satisfiable clause embedded in it.
- Conversely we will show that, if there is no such pair of paths (one from x_i to \bar{x}_i and another from \bar{x}_i to x_i) then a satisfying assignment can be found for ϕ , by the following algorithm.

Step – 1 For each variable x_i , check if there is a path from x_i to \bar{x}_i . If there is such a path, assign $x_i = \text{false}$. For all variables V such that there is a path from \bar{x}_i to V , assign V to true and \bar{V} to false.

Step – 2 for each variable x_i , check if there is a path from \bar{x}_i to x_i . If there is such a path, assign $x_i = \text{true}$. For all literal V such that there: a path from x_i to V , assign V to true and \bar{V} to false.

Step – 3 Propagate all the “true values” down the paths, and the “false values” up the paths.

- So this algorithm never assigns both true and false values to the same variable.
- The entire algorithm will be executed in polynomial time.
- Therefore $2SAT$ is in **P**.
