

### Decidability of the language

**Given:** In this a language  $A_{\epsilon CFG}$  is given.

**Proof:** For showing that the language  $A_{\epsilon CFG}$  is decidable, build a Turing machine  $T$  for deciding the language  $A_{\epsilon CFG}$ . For all Context free grammars  $G$

- If the grammar  $G$  derives  $\epsilon$  then  $T(\langle G \rangle)$  accepts
- If the grammar  $G$  does not derive  $\epsilon$  then  $T(\langle G \rangle)$  rejects.

### Constructions:

For proving the decidability of  $A_{\epsilon CFG}$  firstly convert the context free grammar  $G$  into an equivalent  $G'$  in CNF. If  $S \rightarrow \epsilon$  is the rule in the CFG  $G'$  then it means that  $G'$  derives  $\epsilon$ .

If the CFG  $G'$  derives  $\epsilon$  then  $G$  also derives it as  $L(G) = L(G')$ . As  $G'$  is in CNF so only possible  $\epsilon$ -rule in  $G'$  is  $S \rightarrow \epsilon$ . If  $G'$  contains  $S \rightarrow \epsilon$  in production rules then  $\epsilon \in L(G')$ . If  $G'$  does not contains the rule  $S \rightarrow \epsilon$  then  $\epsilon \notin L(G')$ .

Turing machine  $T$  = on input  $\langle G \rangle$  where  $G$  is a context free grammar

- Convert the grammar  $G$  in CFG  $G'$ .
- If  $G'$  contains the production rule  $S \rightarrow \epsilon$  then accept it.
- Otherwise reject it.

### Conclusion:

From the above construction it is clear that  $\langle G \rangle \in A_{\epsilon CFG}$  iff  $\langle G, \epsilon \rangle$  is also belongs to the  $A_{CFG}$ . So the above construction is correct. Hence the language  $A_{\epsilon CFG}$  is decidable.
